Credit Name: CSE3010 - Computer Science 3

Assignment Name: Break A Plate

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

I started off designing the base design of the GUI so that I knew what components I needed to include, and then planned out my code in sections.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

At first, I was confused on how the game should operate, so I

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

I broke the plan into smaller steps before coding. I first generated three random numbers from 1-3 and made it display the correct prize and plates broken, according to the numbers generated. Once I made sure this worked, then I proceeded to attempt to determine how to make the game play when the button pressed reads "Play", but reset when the user presses "Play Again".

How did you decide on the tools, data structures, or algorithms to use?

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in small pieces, and made sure it worked before continuing.

How did you test your solution along the way to make sure it was working?

I first worked on displaying the prizes and plates, so I re-ran the code until I saw both the sticker and tiger displayed with their correct amount of broken plates. I then implemented the code to reset the game, and tested it, when the code didn't work how I planned, I reworked it, and retested it until it ran properly.

Overcoming Challenges

What part of the problem was the most difficult for you?

Figuring out how to properly get the text of the button, so that it different events would occur depending on what the button said.

How did you handle moments when you felt stuck or unsure of what to do next?

I looked back on past skill builders to try to figure out other ideas on how the code can work.

Learning

Was there anything you learned that you think will help you with future challenges?

I learned more on what .getText and .equals does, which can help me more accurately complete new code in the furture.
