Assignment Name: Local Bank

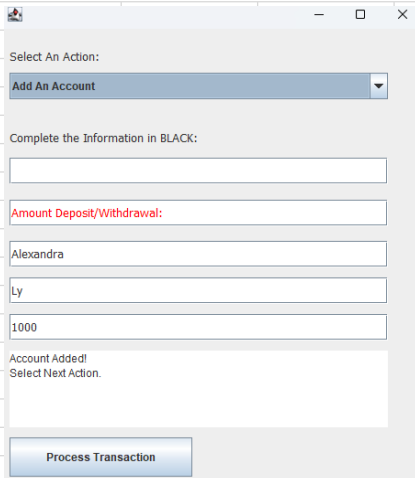

Error Log Entry

What error message did you encounter (if any)?

No Error Messages.

What unexpected behavior did your program exhibit?

1. I put the 'titles' into each text field instead of using a label. This created an additional issue, needing the label for each text field to be reset after the user finishes their action.

2. When displaying account ID to the user after adding an account, it would return as null

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

1. Logic Error - didn't take into consideration that not having labels would mean it needed to be reset each time
2. Logic Error - needed to fully read all the lines of code of each class (bank, account, and customer) to understand what each class did. Called to the wrong class when trying to get the ID, had no account connected to it.

Include a screenshot of specific lines of code.

1. No specific lines of code caused this error. Just missing a piece

```
2. public void actionPerformed(ActionEvent e)
{
    if(actionBox.getSelectedItem().equals("Add An Account"))
    {
        String firstN = fN.getText();
        String lastN = lN.getText();
        String beg = begBalance.getText();
        double bal = Double.parseDouble(beg);

        String accId = act.getID();

        bank.addAccount(firstN, lastN, bal);

        display.setText("Account Added!"
            + "\nAcc ID:" + accId
            + "\nSelect Next Action.");
    }
    else if(actionBox.getSelectedItem().equals("Deposit"))
    {
        String acc = accNum.getText();
        String amount = Amt.getText();
        double amt = Double.parseDouble(amount);
        bank.transaction(1, acc, amt);

        display.setText("$" + amount + "deposited.");
    }
}
```

How did you fix the issue?

1. I added code that reset the labels after the action the user performs is finished.
2. Called to the correct class, which already had the .getID() implemented in it already.

Provide the corrected code or solution using a screenshot.

```
1. accNum.setText("Account Number:");
   Amt.setText("Amount Deposit/Withdrawal:");
   fN.setText("First Name:");
   lN.setText("Last Name:");
   begBalance.setText("Beginning Balance:");

2. if(actionBox.getSelectedItem().equals("Add An Account"))
{
    fN.setText("");
    lN.setText("");
    begBalance.setText("");
    Amt.setText("");
    accNum.setText("");
    act.setID("");
    display.setText("");
}
```

```
String firstN = fN.getText();
String lastN = lN.getText();
String beg = begBalance.getText();
double bal = Double.parseDouble(beg);

String accId = bank.addAccount(firstN, lastN, bal);

display.setText("Account Added!"
    + "\nAcc ID: " + accId
    + "\nSelect Next Action.");
}
```
