Credit Name: CSE3010 - Computer Science 3

Assignment Name: Local Bank

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

I started by creating the GUI, and then figured out what actions were needed to be performed, addding them to the combo box. From there, the visuals were completed and I then began trying to piece the code together to make it operate it's needed actions.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

At first I was confused on how to utilize multiple classes, as I had forgotten. However, after being taught how to connect/call to classes, I slowly began to remember.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

I broke the problem into smaller steps: GUI, action 1: Add and Account, action 2: delete account, and so on

How did you decide on the tools, data structures, or algorithms to use?

I chose the components by trying to make the application look as organized as possible, and easy for the user to use. Other than that, I mostly followed the example given.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in small pieces following the broken up plan.

How did you test your solution along the way to make sure it was working?

Since there was many different actions the user could perform, after finishing one action I tested to make sure it worked, and that it properly interacted with the other actions. Once it was working properly, I continued to coding the next action.

Overcoming Challenges

What part of the problem was the most difficult for you?

Figuring out how to implement the other classes into the code, and relearning how they interact with each other. I spent most of my time having to read all the lines of pre-written code to figure out what is needed to perform the action I wanted. (I didn't realize at first that I only needed to call on the bank class, because it already utilized the other classes)

How did you handle moments when you felt stuck or unsure of what to do next?

I sometimes went onto working on the code that I knew exactly what to do, as I completed that it would usually help me understand more about the other pieces of the code, so I could go back and complete it fully.

Learning

Was there anything you learned that you think will help you with future challenges?

I got a refresher on connecting multiple classes, helping me work with more complex and longer code.
