Credit Name: CSE2130 - File Structures & Exception Handling

Assignment Name: WordGuess

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

I went to the page in the textbook where the task was listed so I coud read exactly what I needed to complete. I then read over the templete provided in D2L, and then started working through the code starting from the top.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

At first, everything seemed pretty straight forward because the templete porvided a path to follow, however as I worked through it, sometimes the templete brough confusion because I would think of a different way to complete the task, which did not follow the templete, or I felt as if the way the templete does it doesn't fit with what we learned. Example: Having to use numWords = Integer.parseInt(readFile.readLine()); instead of the usual while loop to read the file, and then closing and reopening the file to read the secret word.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

I broke the problem into the smaller steps shown inthe templete. 1. Select a secret word. 2.Begin the game 3.Allow player to make a guess 4.Finish game + display number of guesses

How did you decide on the tools, data structures, or algorithms to use?

I mostly just followed the structure given in the templete however, I decided to use for loops instead of while loops because I needed the code to run a certain amount of times.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in small pieces listed above.

How did you test your solution along the way to make sure it was working?

For the first part, selecting a secret word, I wrote the code for it and then make it simply display the secret word out to me with System.out.println so that I could make sure it was randomly choosing one.

Overcoming Challenges

What part of the problem was the most difficult for you?

Figuring out get the number of words without fully reading the file, so that I can read the file to select the secret word. And then also figuring out how to replace the letter in the secret word when the user correctly guesses.

How did you handle moments when you felt stuck or unsure of what to do next?

I looked into the textbook to see if there was any examples that accomplished the small tasks I was struggling on, and used it as reference for my code.

Learning

Was there anything you learned that you think will help you with future challenges?

I learned how to get the number of words in a file
